

Put the rooftop to work.

A solar concept for the long western apartment building in Richmond, Victoria.

39.6 kW

proposed DC capacity

53.7 MWh

estimated yearly electricity

90 panels

440 W per module

Annual estimate is before a verified local-shading adjustment; actual output will vary.

BEFORE

AFTER | 90-PANEL CONCEPT

Matching model views. Building details and rooftop equipment are approximate.

Support shared services

Solar could offset eligible **daytime common-area electricity**, including pumps, ventilation and lift operation. Actual coverage depends on the common-property meter, equipment schedules and daytime demand.

Give buyers a tangible feature

The roof layout and sun-study clip make the solar proposal easy to explain in sales conversations. A verified design can support a credible sustainability story and potential common-area cost savings, without promising a sale-price premium.

NEXT STEP: REQUEST A SITE ASSESSMENT & QUOTE

Confirm roof access, equipment and structure; review common-area electricity data; then obtain a site-specific layout, generation estimate and installation quote.

Basis: PVGIS ERA5 (2005-2023), site coordinates -37.8242866, 145.0103873, 10° tilt, approximately 8° east of north and a 14% system-loss input. Local roof/building shading is not yet quantified annually.

Concept only: Image-based dimensions, equipment heights and access clearances remain provisional. Structural, mounting, wind, electrical and metering design require verification. No savings or full-load coverage is guaranteed.
